Reading: Higher ACC and lower AEOD/ASPD are better. ACC is in percent; gaps are in [0,1]. AEOD is the absolute TPR gap, not full equalized odds. Entries are mean +/- sample SD across shared seeds. Low gaps can accompany constant or poor predictions; all outcomes are retained. Shading identifies GuardFed, not a winning result.

Method scope: Native predictions preserve each method's own postprocessing; this does not isolate aggregation effects. FairFed/FairGuard/composition, FedAA and LASA are documented adaptations. LoGoFair-DP uses fitted demographic-parity postprocessing, 20 image-ID virtual cohorts (not training clients), fit seed 1719 and 30 postprocessing rounds. FLGMM uses the author-code full-model/largest-cluster adaptation and native uncalibrated outputs.

Coverage and provenance: Eleven methods, two distributions, five conditions and 10 seeds give 1100 evaluation records, not 1100 independent training models: LoGoFair reuses FedAvg checkpoints. Backbone checkpoints are terminal round 70. FLGMM contributes 96 new and 4 explicitly reused screen records; its selected recipe is warmup 20/control width 2.0/local learning rate 0.001. Original mixed training/replay environments and separate CPU saved-state verification remain disclosed; no cross-runtime equivalence is claimed.

Selection boundary: Seed 91001 participated in validation selection; other validation seeds and historical test metadata were exposed. The 9/6-seed panels are sensitivity views, not untouched test cohorts. No score ranking, significance, final-test or complete 17-method claim is made. This display does not select the manuscript's final primary endpoint.

Source: root-adopted eleven-method native1100 display table; no new statistics, fits, inference or training.

CelebA - eleven-method native validation comparison

Appendix sensitivity analysis | 9 shared seeds: 91002-91010 | mean +/- sample SD (ddof=1)

Native validation view. Terminal checkpoints; no superiority highlighting. Eleven methods do not constitute the full 17.

Reading: Higher ACC and lower AEOD/ASPD are better. ACC is in percent; gaps are in [0,1]. AEOD is the absolute TPR gap, not full equalized odds. Entries are mean +/- sample SD across shared seeds. Low gaps can accompany constant or poor predictions; all outcomes are retained. Shading identifies GuardFed, not a winning result.

Method scope: Native predictions preserve each method's own postprocessing; this does not isolate aggregation effects. FairFed/FairGuard/composition, FedAA and LASA are documented adaptations. LoGoFair-DP uses fitted demographic-parity postprocessing, 20 image-ID virtual cohorts (not training clients), fit seed 1719 and 30 postprocessing rounds. FLGMM uses the author-code full-model/largest-cluster adaptation and native uncalibrated outputs.

Coverage and provenance: Eleven methods, two distributions, five conditions and 10 seeds give 1100 evaluation records, not 1100 independent training models: LoGoFair reuses FedAvg checkpoints. Backbone checkpoints are terminal round 70. FLGMM contributes 96 new and 4 explicitly reused screen records; its selected recipe is warmup 20/control width 2.0/local learning rate 0.001. Original mixed training/replay environments and separate CPU saved-state verification remain disclosed; no cross-runtime equivalence is claimed.

Selection boundary: Seed 91001 participated in validation selection; other validation seeds and historical test metadata were exposed. The 9/6-seed panels are sensitivity views, not untouched test cohorts. No score ranking, significance, final-test or complete 17-method claim is made. This display does not select the manuscript's final primary endpoint.

Source: root-adopted eleven-method native1100 display table; no new statistics, fits, inference or training.

CelebA - eleven-method native validation comparison

Appendix sensitivity analysis | 6 shared seeds: 91005-91010 | mean +/- sample SD (ddof=1)

Native validation view. Terminal checkpoints; no superiority highlighting. Eleven methods do not constitute the full 17.

IID (alpha=5000)

Original mixed training/replay environments and separate CPU saved-state verification remain disclosed; no cross-runtime equivalence is claimed.

Selection boundary: Seed 91001 participated in validation selection; other validation seeds and historical test metadata were exposed. The 9/6-seed panels are sensitivity views, not untouched test cohorts. No score ranking, significance, final-test or complete 17-method claim is made. This display does not select the manuscript's final primary endpoint.

Source: root-adopted eleven-method native1100 display table; no new statistics, fits, inference or training.
